"Busy students juggling classes, labs, and work need a fast way to turn dense readings into spaced-practice flashcards so they actually remember, not just re-read."

Students often split time across campus, jobs, and family, so readings pile up across LMS pages and PDFs. The core problem is converting dense material into quizzable chunks quickly enough to keep up. Without an easy pipeline from text to practice, people default to passive re-reading, which feels productive but does not stick.

A useful solution should be lightweight and device-agnostic. In a few minutes it should take a reading or paste-in and output clean prompts scheduled with spaced repetition, so study time shifts from re-reading to retrieval practice and long-term retention improves.
